

Image Manager

Image Manager is an online system that allows you to easily add photos to web pages from any digital device (camera / PC).

It allows multiple users to add and manipulate images and display on a web page.

In combination with a quality web page you can instantly

- Add and resize photos
- Create a thumbnail copy
- Add customisable copyright or text over the image
- Add an image over-layered to prevent illegal copying of your image
- Add text to be displayed underneath your image
- Converts images of different types into web ready images

The web is about text and images. Using Image Manager you are able to add images up to 20 times faster than doing it manually using a graphics package like Photoshop and without the technical knowledge required in some applications.

Integrating Image Manager into an existing web site is straightforward. This system can be used as a Photo Gallery that allows you to place images into Categories or Catalogues. It can be combined with a shopping cart and any customisable feature available on the web and allow you to gain input from many people to your web site. At GoldCoastLogin.com.au we specialise in creating custom database backed web solutions, which can include Image Manager amongst other systems.

This system includes a secure login and authentications at every stage to ensure only the desired people have access. It also comes with the functionality to issue usernames and passwords for others to use the system securely.

One of the most difficult tasks in a quality web design is gathering quality content. Using this system people with limited technical knowledge can actively contribute to a web site. This is the biggest advantage of Image Manager. Anyone who can operate a digital camera or use a PC will have no problems using Image Manager.

An online example that utilizes this system can be viewed at www.SaveOurSpit.com/Photos
